

Abilene Network

Major Project Part II

Isolating Suspicious BGP

Updates

To Detect

Prefix Hijacks

Author: Abhishek Aggarwal (IIT Delhi)

Co-authors:

Anukool Lakhina (Guavus Networks Inc.)

Prof. Huzur Saran (IIT Delhi)

AGENDA

Implementation

Results

Conclusions

References

Motivation

- BGP routes can be hijacked by a misbehaving or compromised router. This can have serious consequences
- Accidental hijack
 - AS 9121 incident
- Malicious hijack
 - Used to send SPAM

Objective

AGENDA

Prefix Hijack: Example

a. True origin AS 52 announces prefix
131.179.0.0/16

b. False origin AS 110 announces prefix
131.179.0.0/16

Figure: AS 110 hijacks prefix of AS 52

Basic Philosophy

AGENDA

Motivation

Objective

Background

Data Analysis

Characterization

Classification

Implementation

Results

Conclusions

References

- Analyze past BGP data to establish normal behavior for a prefix
 - Associate a state with every prefix at a border router
 - Origin AS is state variable
 - Track changes in the state to figure out normal changes for prefix
- Analyze incoming updates and flag the ones violating the normal

AGENDA

For ~ 88 % multi origin prefixes:

Conflicting ASs have overlapping AS paths

Total Prefixes: 124

Figure: Percentage breakup of prefixes on AS path relationship of conflicting ASs

Characteristics of Possible Prefix Hijacks

AGENDA

Motivation

Objective

Background

Data Analysis

Characterization

Classification

Implementation

Results

Conclusions

References

- Change in state of prefix
- Multi Origin AS conflict
- False origin AS has
 - Low percentage hold time
 - Malicious routes are short lived
 - Shorter AS path length
 - Distinct or Cross AS path relationship
- Deaggregated prefix

Metrics

Motivation

Objective

Background

Data Analysis

Characterization

Classification

Implementation

Results

Abilene Network

Conclusions

References

- Past BGP data about a prefix can help to determine safe changes to the state of the prefix
- Percentage hold time change, AS path length change and AS path relationship are useful metrics to filter out valid MOAS incidents
- Normally, percentage hold time change and AS path length change have a negative correlation

Key Benefits

- Help network operators
 - Enable manual data analysis
 - Inject new detection schemes
- Readily deployable
- Incremental deployment
- Build base truth on prefix hijacks
